

Core Concepts Guide

Design principles for a collaborative analytics workspace that learns safely.

RETRIEVAL BEFORE GENERATION

01 Context first

Give schema, metrics, references, and resolved filters before requesting SQL.

02 Retrieval first

Tier 3 checks templates and playbooks before any model call.

03 Learn slots

Save reusable metric, dimension, reference, and date-window slots.

04 Confirm fuzzy matches

Clicked tags are explicit; typed matches ask the user to confirm.

05 Safe SQL boundary

Single SELECT, FROM table o, schema-only columns, no mutations.

06 Lookup after SQL

Resolve lookup filters before SQL; merge display fields after rows return.

07 Feedback teaches

Only approved results become reusable templates.

08 Visible architecture

Show whether Tier 1, Tier 2, or Tier 3 architecture was used.

09 Explain enrichment

Show the data merge relationship whenever lookup fields are added.

10 Calm control

Use quiet surfaces, limited color, clear status, and deliberate motion.

Senior design rule

A successful response should either answer the user or teach the system a safer reusable pattern for the next user.
